Detect what the human ear cannot.
AI-driven analysis for deepfake voice, synthetic speech, replayed audio, and voice spoofing.
Analyze Audio
Explore AV-ASOC

Bring the audio. Live or recorded.

The analyzer is its own workspace, built for working with the signal rather than reading about it.

Live microphone

Check permission, pick an input device and record with a live waveform, level, pitch and speech activity.

Upload

Drop WAV, MP3, M4A or FLAC. Files are decoded in your browser.

Playback

Play, pause, seek, change speed, loop a region and navigate by keyboard.

Crop

Select the part that matters and trim to it before analysis.

Open the analyzer

Data structures that do the work.

Each one has a job in the pipeline.

Sliding window Cuts audio into overlapping segments for scoring.	**Queue / deque** Buffers incoming live chunks in order.	**Priority queue** Surfaces the highest-priority alerts first.	**Trie** Finds keywords in the transcript as it grows.
String matching Detects multi-word patterns in context.	**Hash map** Looks up sessions, models and metadata in constant time.	**Sorting** Orders history and timeline events.	**Binary search** Maps a timestamp to its window instantly.

Welcome to AV-ASOC.

Bring the audio.

Record or upload audio, trim it to the part that matters, then send it for analysis. Audio stays in this tab.
